

Broadband in Estonia

Estonia has established basic broadband coverage throughout the country, and has brought its broadband targets for 2020 in line with those of the Digital Agenda for Europe.

Summary of broadband development in Estonia

Estonia updated the targets and measures for broadband as part of its Digital Agenda 2020 in early 2014. The strategy envisages full coverage with connections of at least 30 Mbps by 2020 and aims to promote take-up of ultra-fast subscriptions with at least 100 Mbps with the objective that these account for 60% or more of all internet subscriptions by the same year. Estonia is currently deploying a middle-mile network of fibre-optic cables. After completion, 98% of all residential buildings, companies, and public authorities will be located within 1.5 km of at least one fibre-optic network access point. Estonia's new information society strategy is in preparation. With its 5G roadmap, Estonia would like to achieve 5G connectivity in major cities by 2023 and along transport corridors by 2025. Estonia is in the process of putting together the new broadband plan for 2021-2030.

National broadband strategy and policy

Responsible authorities

- The process of broadband deployment is managed by the Ministry of Economic Affairs and Communications (MKM, Majandus-ja Kommunikatsiooniministeerium). The Ministry is responsible for broadband strategy and legislation.
- The Consumer Protection and Technical Regulatory Authority (TTJA, Tarbijakaitse ja Tehnilise

Järelevalve Amet) is a governmental organisation operating in the administrative area of the Ministry of Economic Affairs and Communications. It oversees and regulates technical standards and collects market data. The aim of the Authority is to help implement the national economic policy through improvement of safety, organising the expedient use of limited resources and increasing the reliability of the products in the field of manufacturing environments, industrial equipment, railway and electronic communication.

- The Estonian Broadband Development Foundation (ELASA, Eesti Lairiba Arenduse Sihtasutuse) was established in 2009. ELASA is responsible for the EstWin project, installation of fibre-optic cables and construction of connection points.
- The Estonian Association of Information Technology and Telecommunications (ITL, Eesti Infotehnoloogia ja Telekommunikatsiooni Liit) unites Estonian ICT companies, promotes their cooperation, presents their joint positions regarding broadband network development and acts as a competence centre.
- The Information System Authority (RIA, Riigi Infosüsteemi Amet) is an implementing entity of the structural assistance of the European Union, which administers the European Regional Development Fund support in building the broadband backhaul network.

EstWin project

In 2009, the Ministry of Economic Affairs and Communications and the Estonian Association of Information Technology and Telecommunications (ITL) founded the Estonian Broadband Development Foundation (ELASA). Members of the Supervisory Board of the Foundation include a representative of the Ministry of Economic Affairs and Communications (MKM). The purpose of the Foundation is to implement the EstWin project and to give all residential houses, businesses and authorities a chance to connect to the next-generation broadband network with a transmission speed up to 100 Mbps. The roll-out of the high-speed middle-mile networks to sparsely populated areas, which were unlikely to be covered by market-driven deployment, involves laying over 6000 km of fibre-optic cables and the construction of network access points. These investments are intended to stimulate complementary deployments of last-mile connections by commercial telecom operators. EstWin is funded inter alia from European Structural and Investment Funds (ESIF). The implemented and planned parts of the network are visualised on the online map.

Main aims for broadband development

- Completion of the high-speed middle-mile network
- Expansion of the broadband access network in regions of market failure, by:
 - Reducing administrative burden related to the construction of a communication network by simplifying the relevant legal framework;
 - Obligatory installation of “last mile” connections in new buildings which are part of state-funded development projects;
 - Promoting community initiatives for the development of fast internet connections;
 - Supporting the construction of “last mile” connections in areas of market failure, including rural areas, if necessary;
- Analysing the need for external connections and implementing relevant projects when necessary;
- Ensuring the availability of radio frequencies that meet the requirements of information society to provide internet access for end users in areas where fixed networks are not available;
- Promoting the principle of network neutrality, which means that electronic communication operators may not restrict final users’ access to legal communication services, websites or available platforms;
- Promoting secure public WiFi networks, mainly provided by (local) public sector organisations.

The long term NGA aims are 100% coverage with 30 Mbps and 60% household penetration with 100 Mbps service by 2020.

Main measures for broadband development

A central mapping tool (Communications Coverage Application) on availability of broadband services has been developed by the Estonian Consumer Protection and Technical Regulatory Authority (TTJA). It is an interactive portal, where the users can get information about the availability of broadband services in Estonia.

Data on broadband development and technologies in Estonia

For the latest data on broadband coverage, subscriptions and penetrations, coverage of different broadband technologies and costs check the scoreboard reports and the country reports of the Digital Economy & Society Index (DESI).

Spectrum assignments for wireless broadband

For details on harmonised spectrum assignments consult the European 5G Observatory.

Digital Alps: Partnering with Broadband Competence Offices to build a digital connectivity roadmap for the Alpine Region

Mountain regions have much to gain from digitalisation and broadband connectivity. There is great potential for Smart Villages, SMEs, and access to online services in healthcare, education and much more. Mountain communities, however, face greater obstacles than most in becoming full participants in the European Union's Digital Decade. Their remoteness, in terms of distance and topography, combined with smaller populations, make them technically and financially challenging to reach with broadband infrastructure.

Spain's nation-wide State aid scheme to connect 430,000 people in grey areas

"Spain is the first European country to develop a broadband scheme for grey areas with a geographical scope covering all the nation" states Elena Galindo from Spain's Ministry of Energy, Tourism and Digital Agenda, in this video. Ms Galindo, representing Spain's national Broadband Competence Office, explains that the scheme is needed as approximately "8-10% of the population living in isolated rural and remote areas could not be covered with fast broadband". It aims to cover 3.5 million people, of which 430,000 in grey areas, with minimum speeds of 300 Mbps symmetrical, upgradeable to 1 Gbps.
